

E-learning Hardware Environment

Hardware was purchased for the purpose of setting up an e-learning environment using Blackboard6. A server with storage array from Dell was installed and is integrated into the college's Blackboard6 environment. Application data set and all curricular tools will be installed in this environment. Six different classes will use this hardware and software configuration for either on-line or instructor lead with web assisted classes.

The target date for field testing the curriculum is the spring 2004 semester. Implementation will start on selected classes during the summer 2004 and fall 2004 semester classes.

Below is a diagram of the installed Blackboard6 hardware.
